Harnessing Technology for the Poor and the Environment: Corporate Social Responsibility in International Agricultural Research

Scientific knowledge is a powerful means for solving the challenges of hunger, poverty and environmental degradation facing humanity. Effective science and technology requires cooperation and communication between public and private research organizations achieved through dialogue and partnership.

The Consultative Group on International Agricultural Research (CGIAR) is a strategic alliance of public and private sector investors—developing and industrialized countries, international organizations, civil society organizations and 16 international agricultural research centers—that mobilizes science to benefit the poor and the environment. With a 2002 budget of \$337 million, the CGIAR is the single largest public investment in pro-poor and pro-environment science and technology.

The CGIAR is committed to working in partnership to catalyze the unique capabilities and resources of the public and private sectors needed for innovation, sustainable development and long-term economic growth.

The CGIAR alliance is open to all countries and organizations sharing a commitment to a common research-for-development agenda and willing to invest financial, human and technical resources.
